

# What's New in AniTa for the WEB

The current version of AniTa for the Web is 1.3.0.5. This page lists the important enhancements.

## Important changes since 1.1

- Support of the much faster Java 1.4
- New escape sequences to improve integration with customer's applications
- New Programmer's Guide
- Improved functionality in web browsers and integration with JavaScript
- Improved cursor functionality - blinking - programmatically turn on/off
- Supports hidden automatic login
- Mouse support for copy and paste

## Since the last major release: 1.0.5.3

- The screen font size can now be changed by dragging the window's edge or corner. When the user stops dragging the window, the emulator will select the largest possible font size that will fit into the window, and then adjust the window size accordingly.
- Supports pass-through terminal printing. Print output can be sent from the host application, via AniTa, to the client's printer. Printers can be local, connected to the AniTa workstation, or remote, connected via a network. Screen dump printing can be initiated by either the user or the host. Printing can be in color or black-and-white.
- Supports more languages - currently Swedish, Portuguese, Dutch, German and Spanish. AniTa can be customized for any other language.
- Better support of international character keys has been provided; noticeably when running Gnome and "English" KDE.
- Simplified and improved installation on Linux / UNIX platforms. An install script is now provided to create the janita and janitaconfig startup scripts. Icons are provided for user's to use when adding AniTa to their desktop.
- The configuration program can be started via a button from the emulator when running as an Application.
- Appearance and functionality of the configuration program has been improved; especially for non-Windows platforms.
- Title bar configuration added.
